A2 Documentation

By Misri Bhagat

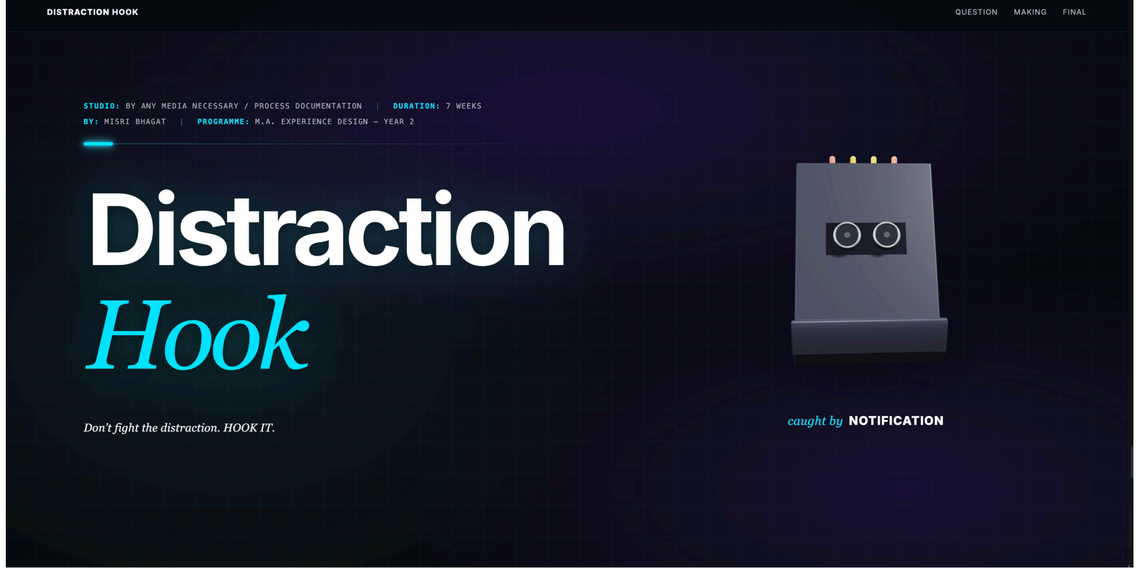

Visual style across the website

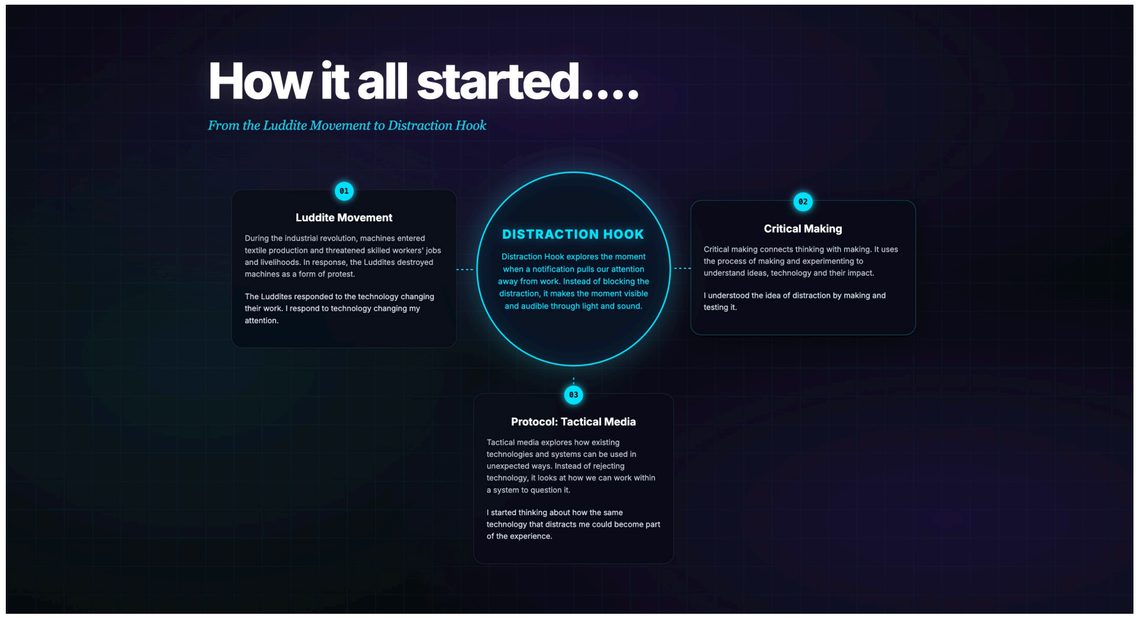

I wanted the website to feel connected to my project, Distraction Hook. The project is about notifications pulling attention away, so I used a dark background to keep the page calm and focused.

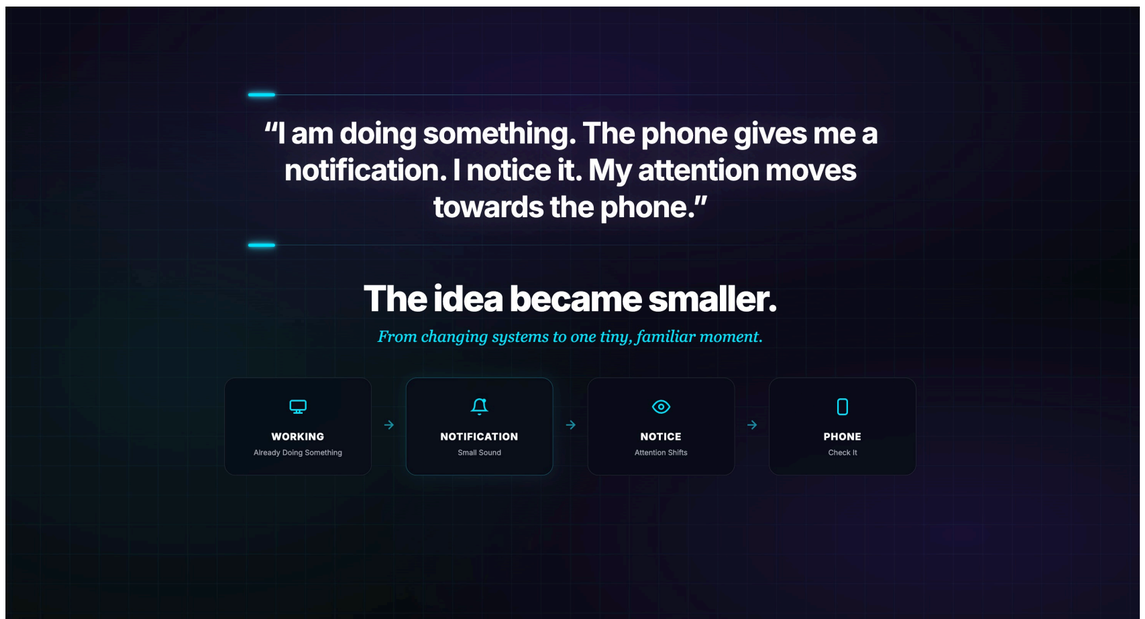

I added a grid to give the page a technical feel. It connects to the process of designing and building the object. I used cyan for small highlights because it is easy to see against the dark background and matches the lights on the physical hook.

I used large headings to help visitors follow the project. I placed the 3D model near the title so people can see the object straight away. The photos and sketches show how I developed and tested it.

The website follows the project from the first question to the final experience. Visitors can learn about the idea, see how I made the object, and try a simple version of the interaction online. I chose this style to make the documentation feel clear, focused, and related to the artefact.

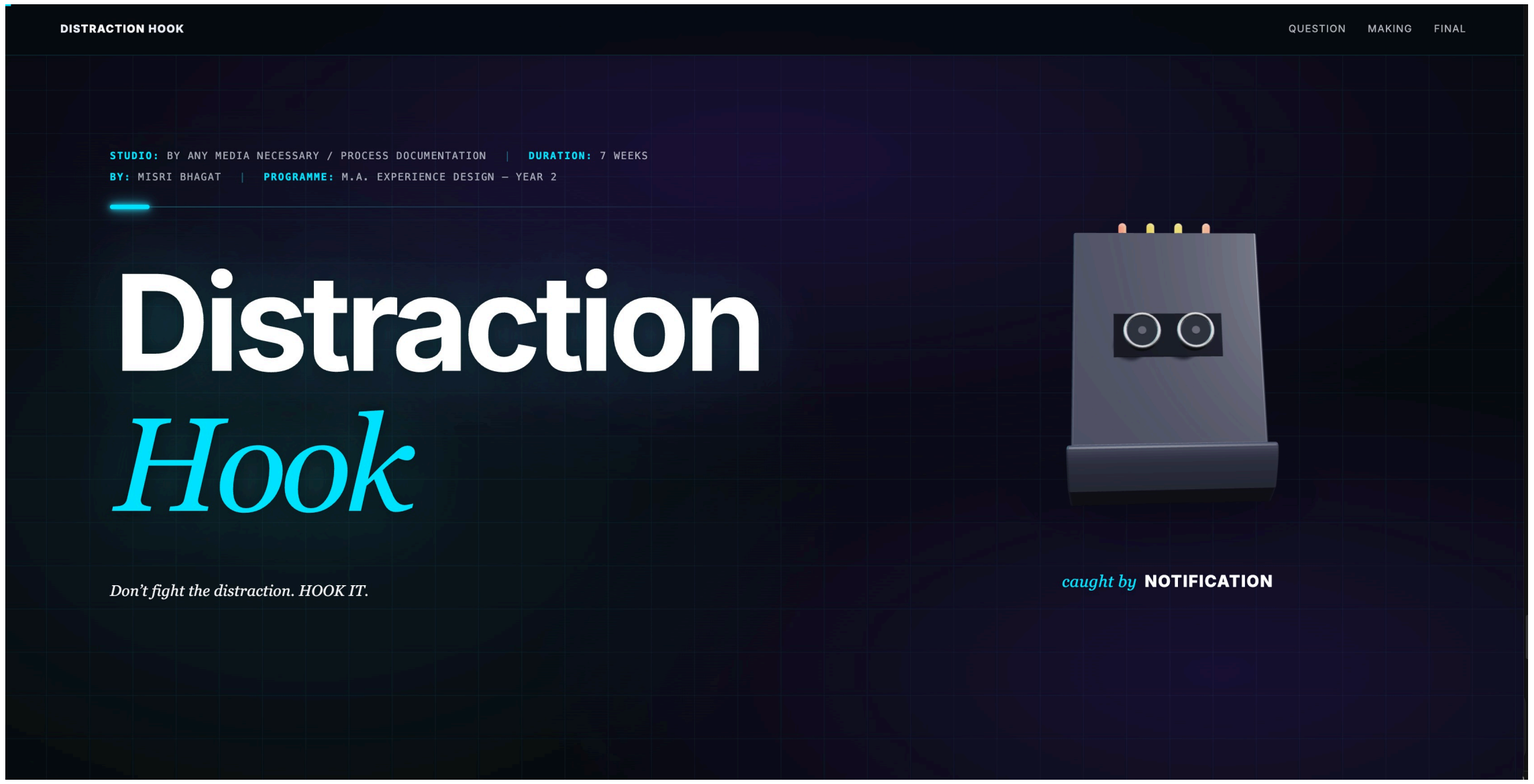

Project overview

Distraction Hook is a project about the moment a notification takes someone’s attention away from work. I made a physical phone stand that responds to a notification sound with light and sound. The project asks whether a distraction can be made noticeable instead of simply blocked.

The website documents the idea, the making process, and the final experience. It also includes a small interaction so visitors can try a simplified version online.

Opening section

The opening section introduces the project title, the object, and its main idea: “Don’t fight the distraction. Hook it.”

I placed the 3D model near the title so visitors can see the object straight away. The dark background helps the model stand out. I used cyan for highlights and draws attention to important details.

The opening also gives basic project information, including the studio, duration, my name, and programme.

How it all started

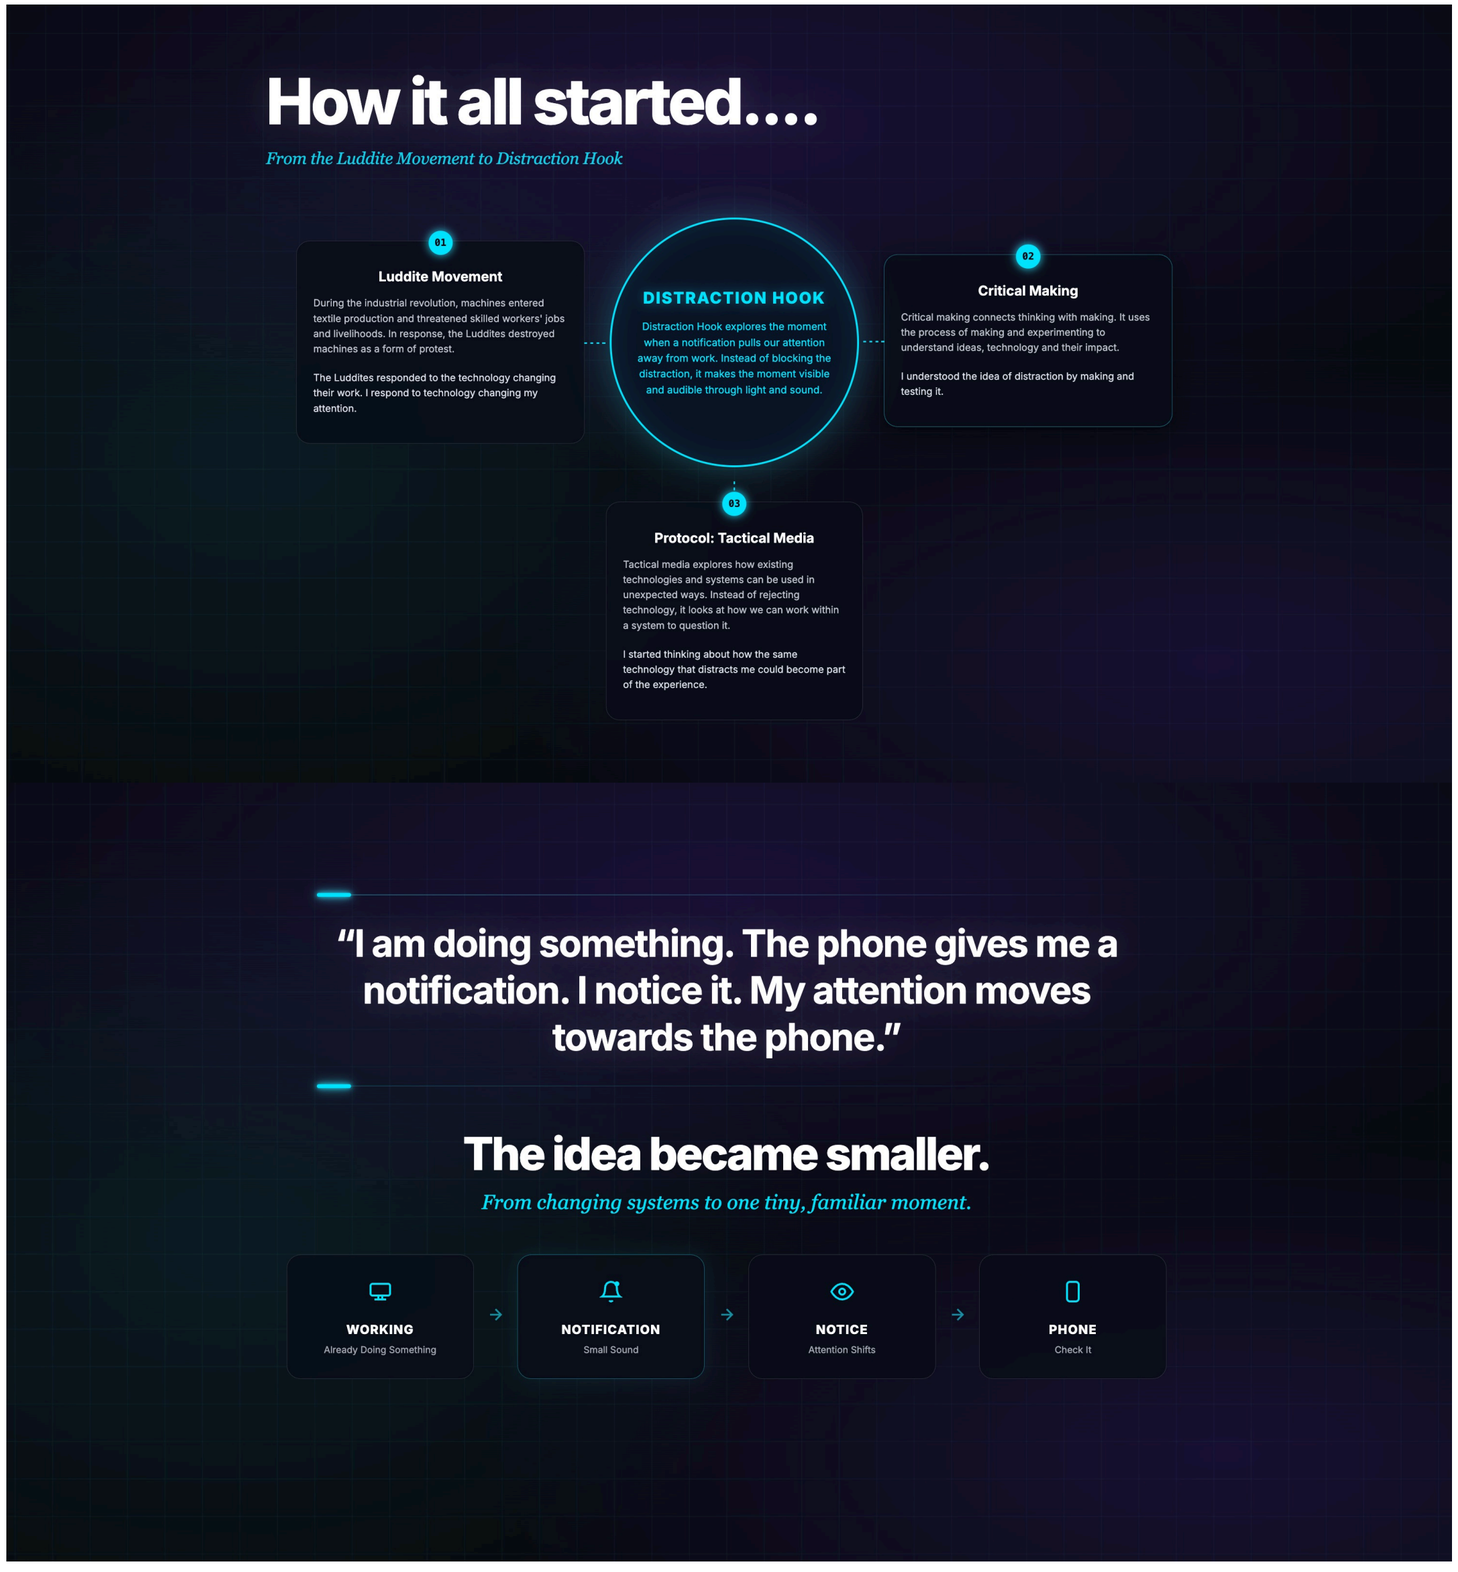

This page explains the ideas that helped me begin the project. I looked at the Luddite Movement, critical making, and tactical media. These references helped me think about people's relationships with technology and how technology can affect our lives.

I connected those ideas to my own experience of being interrupted by phone notifications. This helped me move from a broad interest in technology to one everyday moment: working, hearing a notification, and looking at the phone.

From technology to attention

Here I show how I narrowed down the idea. The sequence - working, hearing a notification, noticing it, and checking the phone - describes the shift in attention that interested me.

I wanted to focus on this small moment because it is familiar and easy to recognize. It gave me a clear situation to explore through the object.

Try the moment

This section gives visitors a simple way to experience the idea on the website. They can press a button to trigger a notification and see the indicator lights respond.

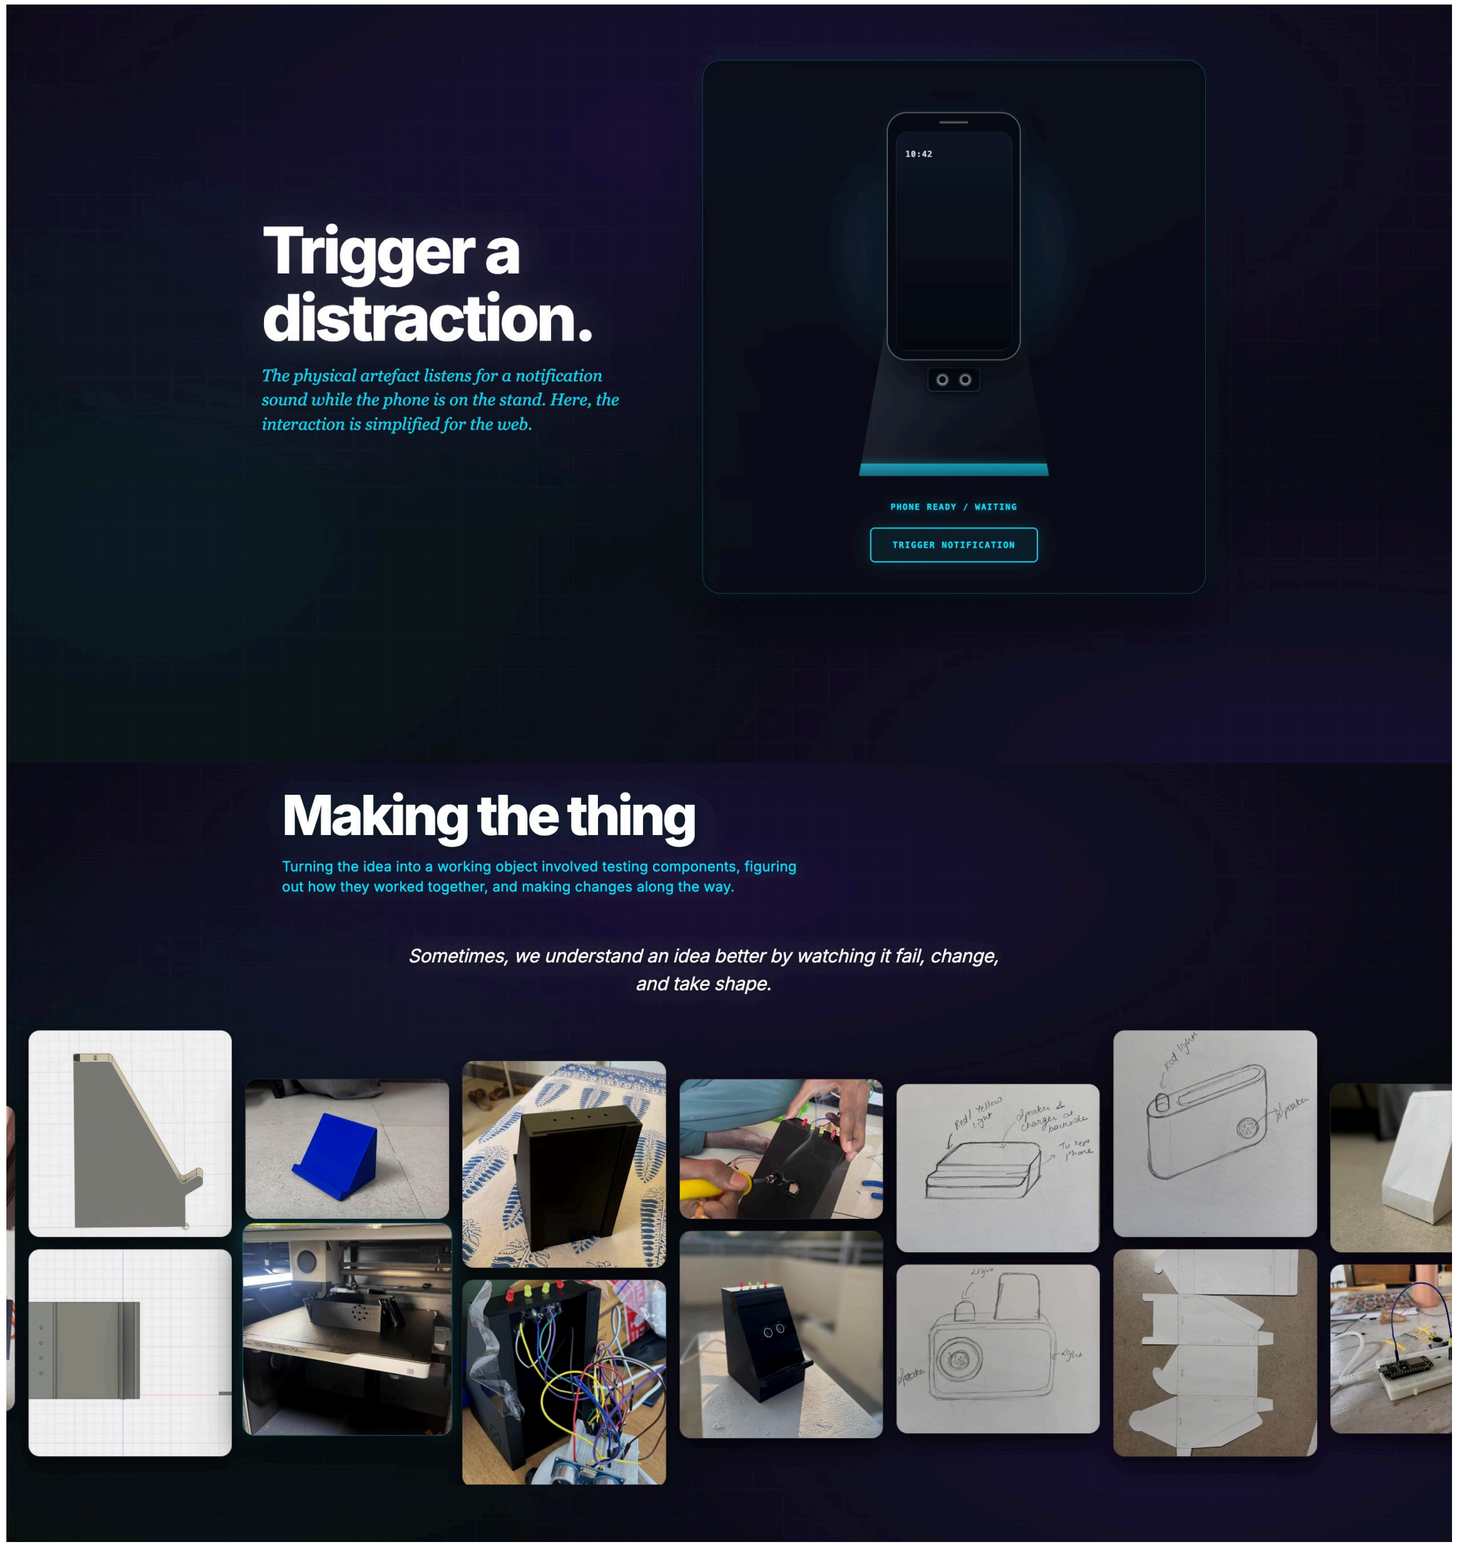

The online interaction is a simplified version of the physical object. It lets visitors understand the basic relationship between a notification and the hook without needing to have the object in front of them.

Making the thing

This page documents how I developed the physical object. It includes sketches, paper prototypes, electronics, tests, CAD work, 3D printing, and assembling.

I included these stages to show how the object changed over time. I tested components and worked out how they could fit together. When something did not work as expected, I made changes and tried again.

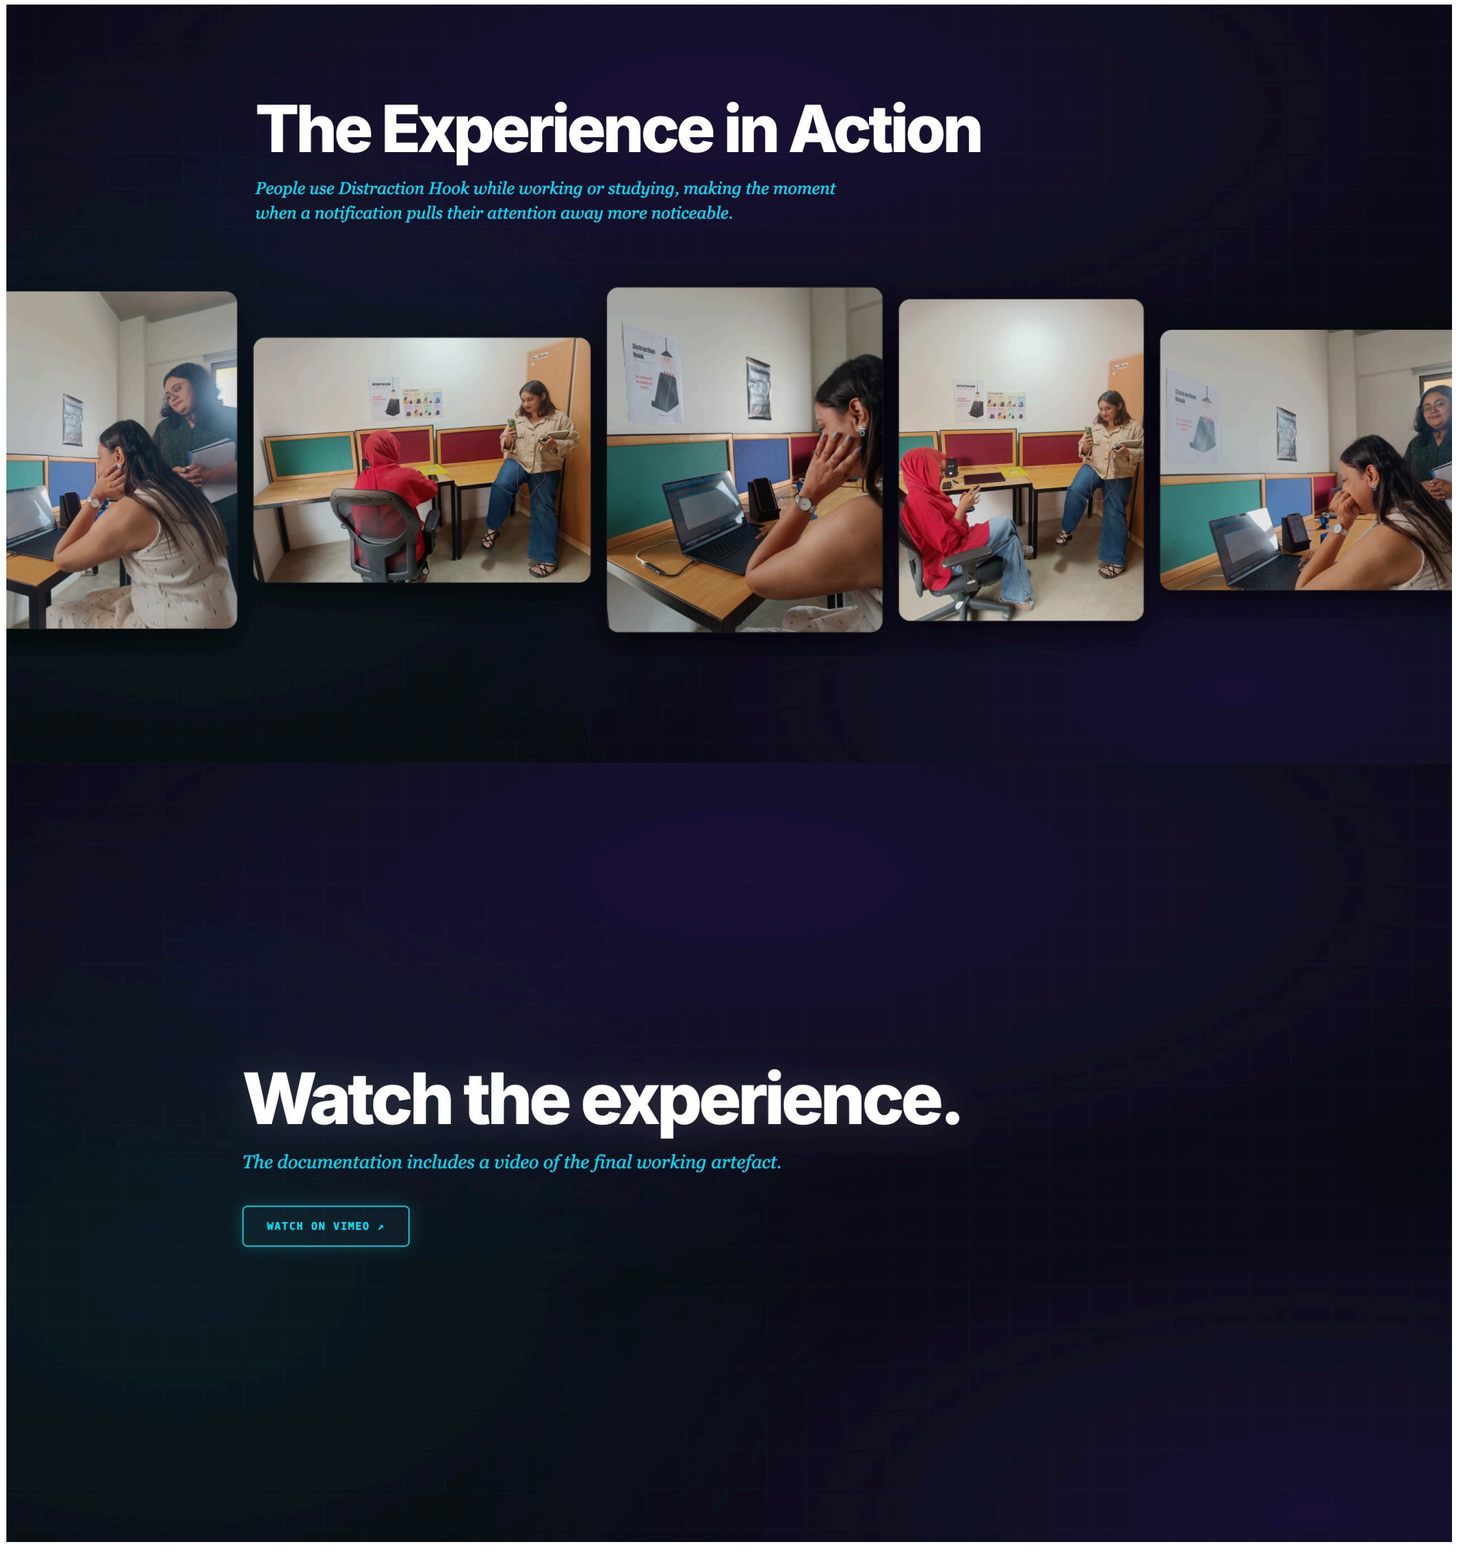

The images are arranged in the order of the process so visitors can follow the work from early ideas to the assembled object. Showing the experiments and difficulties is important because making and testing helped me understand the idea.

The experience in action

This page shows people using the object. It helps explain how the hook fits into a working or studying situation and what happens when a notification is noticed.

I included photographs from testing so visitors can see the artefact in use, rather than only seeing a model or a finished object on its own.

Watch the experience

This page links to a video of the final working artefact. The video gives visitors a clearer view of how the physical project behaves.

I learned it while making it.

The reflection describes what I learned during the seven week project. I began without experience in electronics, and I learned by building, testing, and trying again.

A key lesson for me was that I did not need to know everything before starting. I could learn the skills I needed while working on the project.
