NeuroSpace - Perspectives

The world, in brief

NeuroSpace is a speculative future where your neural interface records human experience continuously, nothing is lost by default(conscious memory , not triggering sub conscious memory). For some this world isn't about the fear of forgetting , it's the fear of remembering too much . In this world memory is editable, shareable, searchable, and even transferable between species.

POV: The Archive Authority - *mémoire*

This is the company responsible for making memory storage.For thie company a deleted memory by the user isn't gone but flagged(apart from mundane tasks - done by AI of that time). They take due advantage of people who delete the memories? (maybe) - that implicate them, embarrass them, or scare them, which means the deletion pile is the richest dataset, many a times.

The company also has a crime-tracking function. If a criminal moved through the city, there's a very high chance they crossed paths with ordinary people who never realized what they'd seen. So the Authority doesn't ask people to testify. It goes straight into the discard/server pile of everyone who was nearby and reconstructs the criminal's path from the memories their owners tried to throw away.

POV: The Teacher- a hacker

The children by law, get no access to their own memory archive until they turn 18 which means she spends every working day watching kids build entire childhoods they won't be allowed to look back on for over a decade. That's what radicalised her.

To take advantage of that (computer teacher - hacker)She fragments her own memory archive and distributes pieces of it across other people and try to do with children. Some with one , some with another. The logic is simple: you can't track a memory that doesn't exist in one place or that is what she thought.

But the world doesn't let her disappear that easily. Iris tracking identifies who she is the moment she's seen; thermal signatures mean that a body in a space registers as *a person*, present, even without a face match. So the authorities can tell something is there, human-shaped, unaccounted for by camera even when their own CCTV has nothing on her. She isn't invisible.

She's a gap in the record with a known outline, which might be worse coz not being tracked reads as suspicious in a system where everyone else is.

POV: The Atypical Patient

Alzheimer's used to mean losing memory indiscriminately.

A new atypicalness was found when people only save their happy moments.

From the inside, this feels like a gift at first. Life reads as unusually, suspiciously good. But it isn't resilience it's an unexercised muscle. When something genuinely bad eventually happens, and it always does, the patient has no practised emotional vocabulary for it. They haven't been quietly processing hard moments all along the way most people do; they've been shielded from ever rehearsing that.that may lead into depression that looks disproportionate from the outside but makes total sense from the inside:.

POV: The Relapser

Reliving a memory in NeuroSpace isn't watching a recording it's like re-entering it, with the same emotional weight it had the first time. For most people that's exactly the appeal: a controlled, occasional way back into a good moment. For the Relapser, it stops being occasional.

He goes back to being a child, to a specific afternoon, over and over, because the present has nothing in it that competes with how safe that memory feels. Each time makes the real world a little harder to want. The danger here isn't the technology malfunctioning , its not wanting to get out of it willingly. Eventually the question isn't whether he *can* come out of the memory. It's whether he still wants to.

POV: The Animal Companion

Memories in this world aren't only shared human-to-human. A person can relive a memory recorded by an animal and an animal can, in some sense, be given one back. Both directions cost something real.

Reliving a memory that belongs to a body unlike your own a dog's,would pushes your own cells past what they were built for. The world's rule is blunt: your body pays the difference, and life expectancy is the currency. Reliving a human memory as a human is close to free- again CLOSE to free. Reliving an animal's is a withdrawal from however many years you have left. Nobody frames this as a punishment; it's simply the metabolic price of borrowing a nervous system that isn't yours.

For environmentalists and animal activists, this is the whole point, and worth the cost: relive a memory recorded by a dog, and you get something no amount of research ever offered an actual, felt sense of how that animal experiences a walk, a threat, a person. It's turned into a genuine tool for empathy and advocacy, at a price only the willing pay.

But the traffic runs both ways, and that's where it gets uncomfortable. Give an animal a *human* memory, and something in it starts to behave differently some people are already doing it deliberately, not for empathy but for labor that means animals that can be "trained" faster because they've been handed a human's problem-solving memory directly, or even used to essentially bootstrap a kind of self-directed learning. The concern isn't hypothetical anymore: once an animal has enough borrowed human pattern-recognition, it can start applying that recognition on its own, teaching itself in ways nobody handed it. Nobody's fully sure yet what an animal *becomes* once it's carrying pieces of a human mind or what obligations that creates toward it.

POV: The Minor

Every child in this world is being recorded from birth, and none of them can see or share a single frame of it until they turn 18. That's the law the Teacher is reacting against .

The stated reason is protective: children mixing timelines, or getting emotionally lost in memories they're too young to process safely, is treated as a real risk worth preventing. But from inside it, the wait doesn't feel protective so much as withheld an entire self, provably recorded,and saved by the governemnt.

Another downsite to this is, once a person at 18 sees all their memory , they might see some that may cause dispute or emotional trauma.

POV: The Broker

Wherever memory becomes valuable, someone builds a market for the pieces nobody's supposed to sell. The Broker deals in fragments exactly the kind the Teacher is scattering to protect herself, except the Broker collects them instead of hiding them, buying loose shards of other people's archives off anyone willing to part with a slice of themselves for money.

A fragment on its own is close to worthless; nobody can act on half a memory with no context. The Broker's actual product is reassembly buying enough scattered pieces from enough different sources to reconstruct something whole that was never supposed to exist as a single file again or is it creating new memories (can be edited and screwed by people too). That makes the Broker the Archive Authority's shadow: the. To the Broker, this isn't exploitation as such , the people already decided their memories were tradeable the moment they accepted money for a piece of one.

POV: The Inheritor

When someone dies in this world, their archive doesn't die with them. It passes on, like property, to whoever's named to receive it (or maybe not ? mayben thats what broker steals) and the Inheritor is the person who now owns a complete, relivable record of someone they loved, or maybe someone they didn't.

This is grief with an unprecedented option attached: you don't have to just remember your mother, you can relive being her, from the inside, whenever you want.Legally, the archive is an asset. Emotionally, it's a person who hasn't finished being said goodbye to.

But what of as as kid you see your parents sign a paper and forge the signs (learnable memory)

POV: The Recipient Animal

Most perspectives on animal memory-sharing come from the human side the activist, the exploiter, the regulator pricing it all. This is the other direction: what it's like to be the animal who's received a piece of a human mind.

The animal may have a new kind of thought, or just borrowed fragments of a human's thought pattern running in an unfamiliar body.
