INCUBATION CAFE & DESIGN SPRINT

- **Iniya R**

Illusion/Connection:

A vending machine can represent a variety of options that are ultimately superficial, so many might be available on screen, but all of them are pre-packaged, limited, and controlled by someone else

Idea Brief:

I wanted to make an easy website. I also attempted to make it fun, like a clickable website. I made a website that has a **vending machine**. Each soda can in it represents an individual, and each soda can is hyperlinked to their individual work on Github. Each user can click on a **soda can** that vends and click on it again to see a short intro page about the project.

The real question I have is how I will connect this vending machine to the idea of a public website comprising all the projects. It's like you vend the simulation you want to see, so choose wisely (just kidding)!

Things I would like to add:

- A pop-up when the mouse hovers over each soda can. A pop-up that explains each object.
- The vending machine currently just drops the soda can from the top, but I need to show an actual push-out of the product, just like in an actual vending machine.
- More depth, clearer instructions, and what a user or visitor needs to do.
- Adding different snacks and not just soda cans.
- A word, "Click," on top, showing how to navigate around this website.
- A convincing vending machine visual replacing the mock one

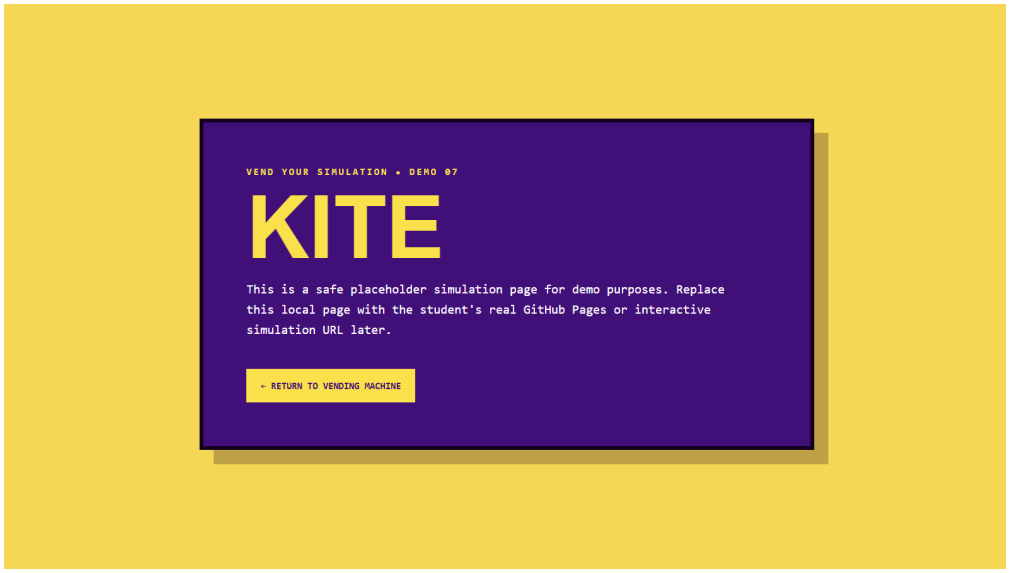

Screenshots

1. Capture of the Pilot page, along with instruction boxes on 3 corners on how to use/navigate in the website

2. To vend a simulation the user has to click on a soda can and it will land on the base ready for step 2

3. A short description of the simulation that pops up after clicking on the seklesoda can again
