## The Idea

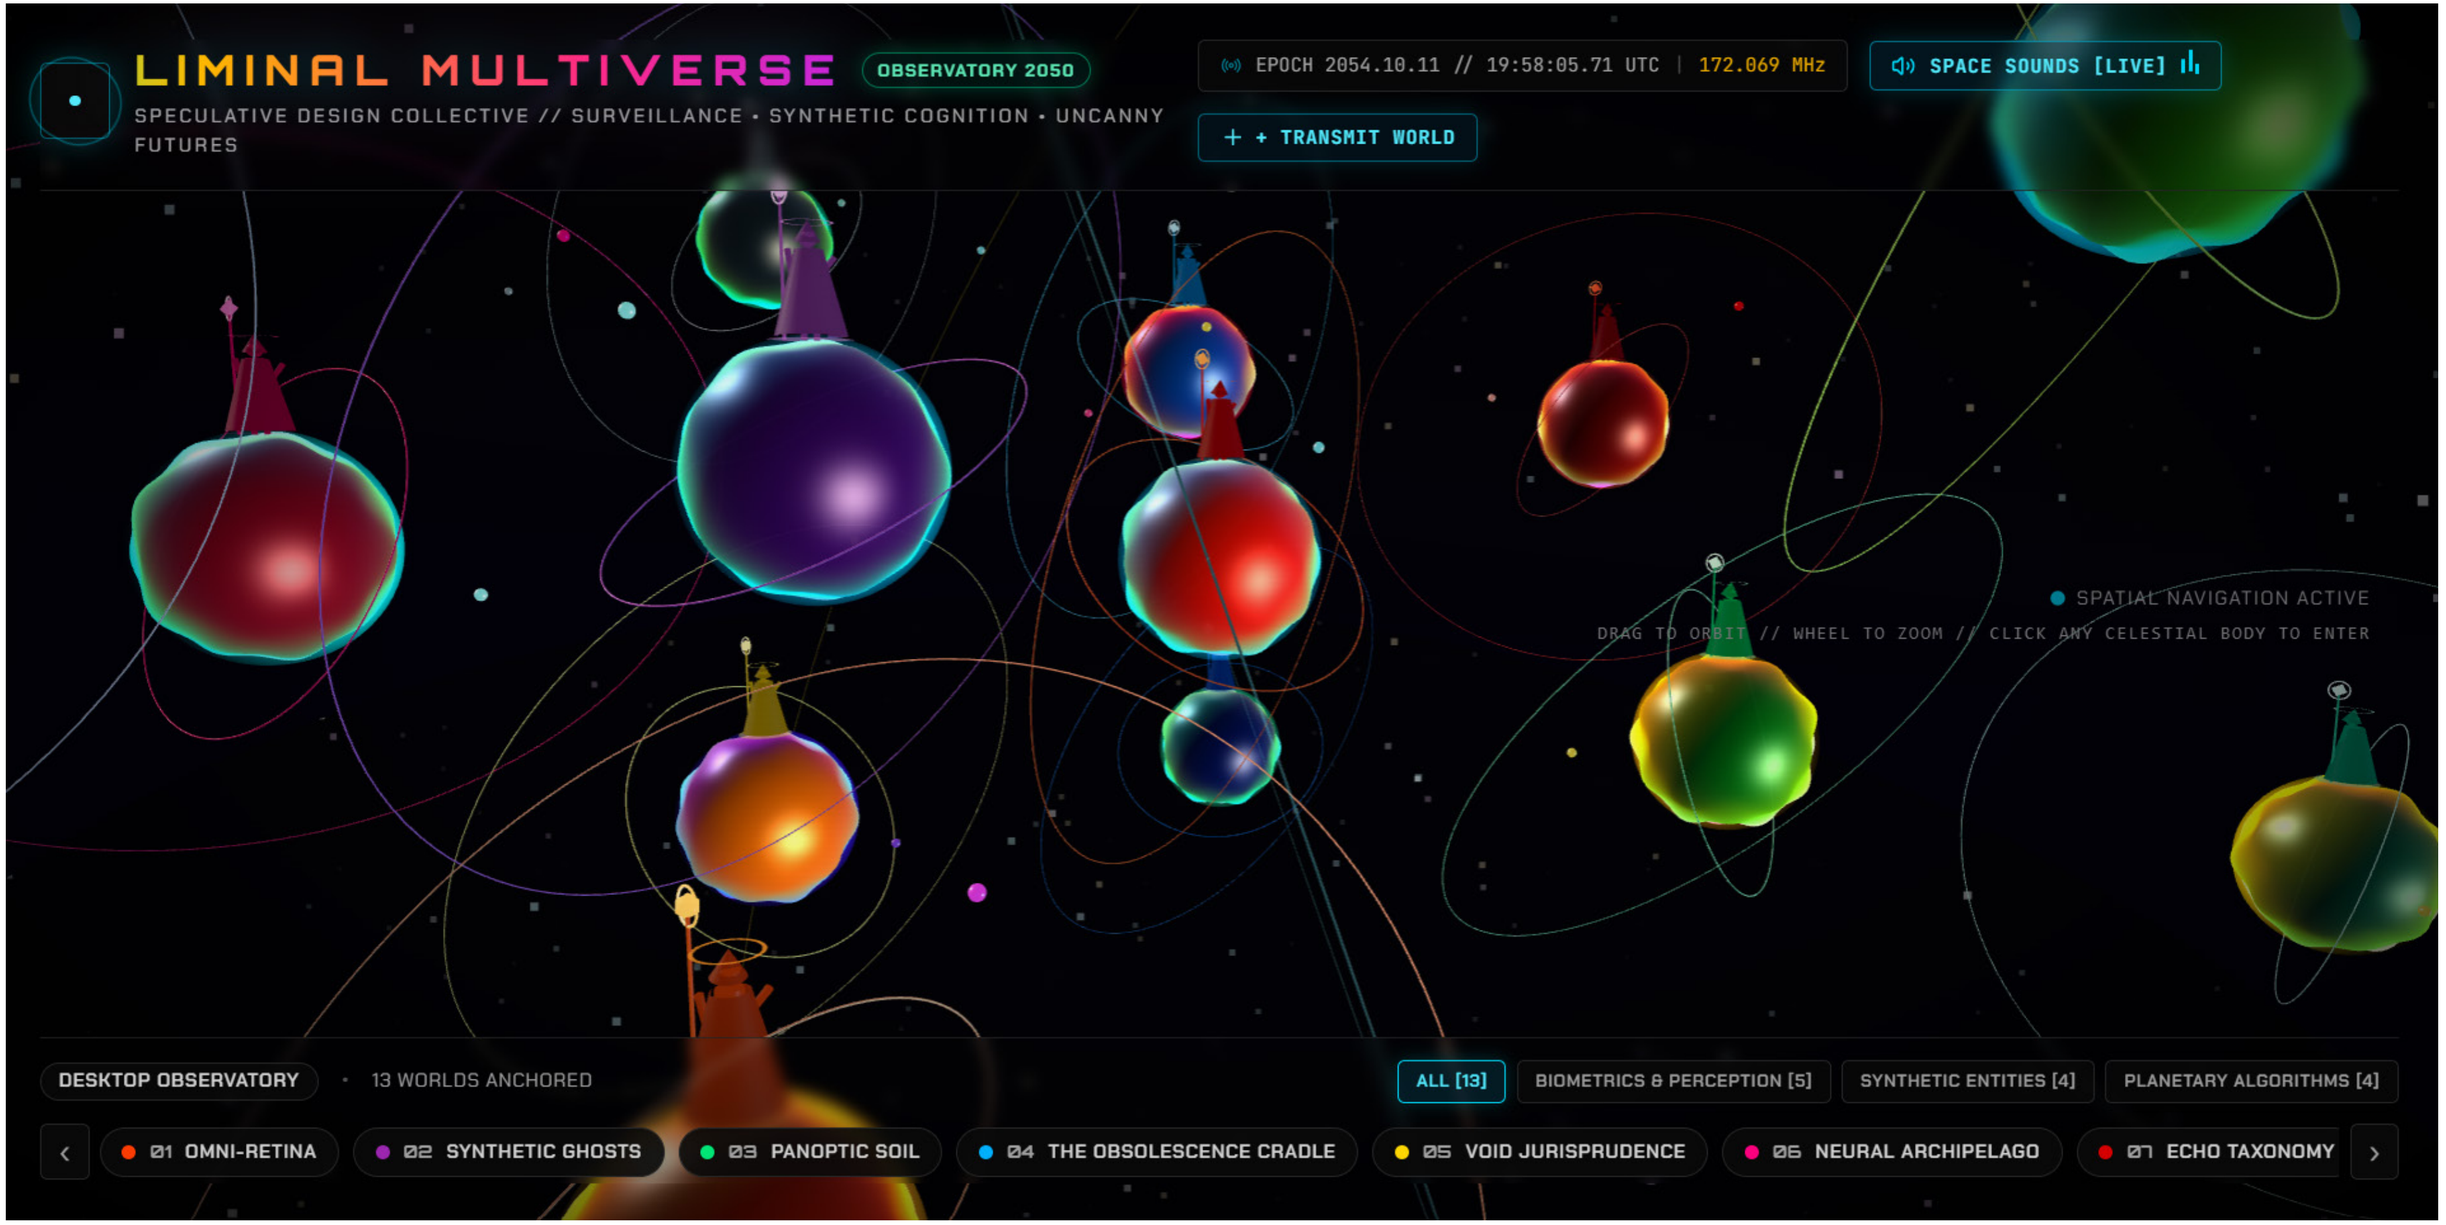

Liminal Multiverse uses the metaphor of a different world existing in one (in-between) space to explore how emerging technologies could reshape human life in the future.

Set between different worlds, the project imagines 13 interconnected yet distinct worlds, each representing an exaggerated trajectory of contemporary systems such as surveillance, algorithmic governance, biometric extraction, and digital identity. Planets become metaphors for these systems and embodied Wizard Project Owners make otherwise invisible technological structures tangible and explorable.

By bringing these imagined worlds together, the project invites visitors to question how present-day technologies might evolve, who they serve, and what alternative futures might emerge

Moodboard

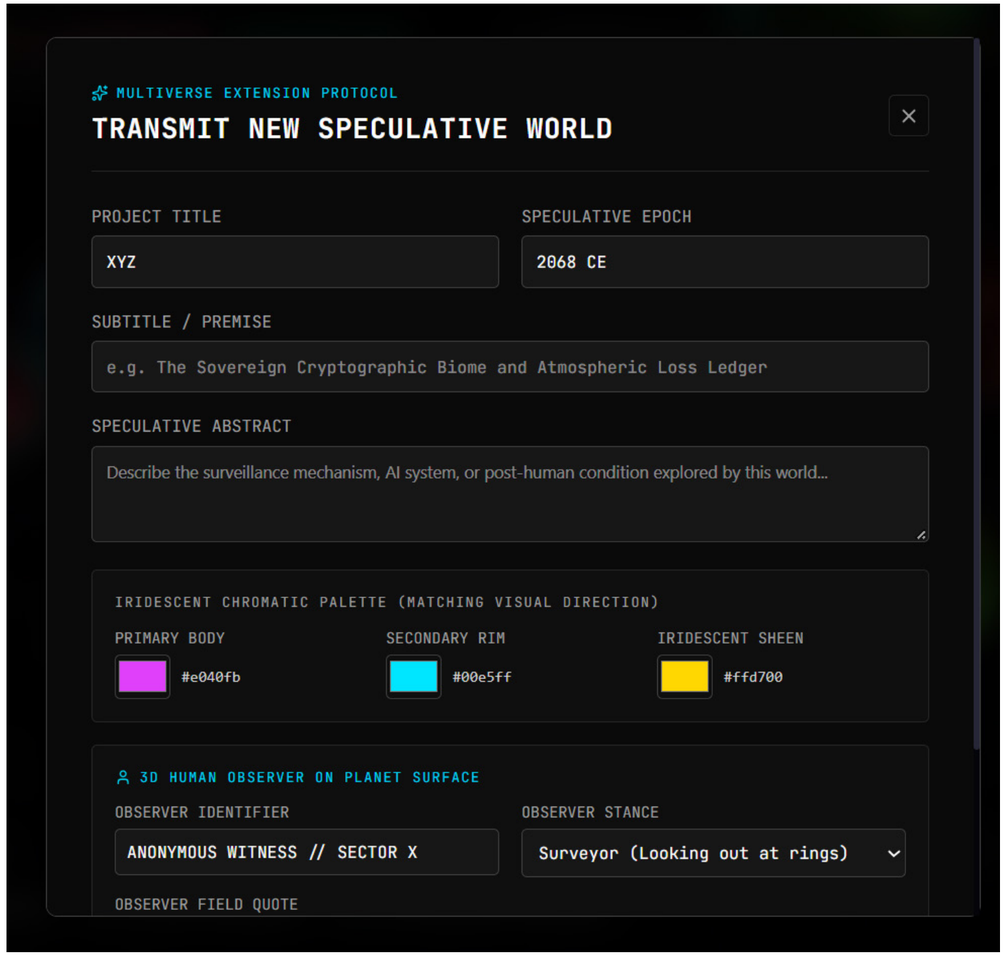

Landing Page

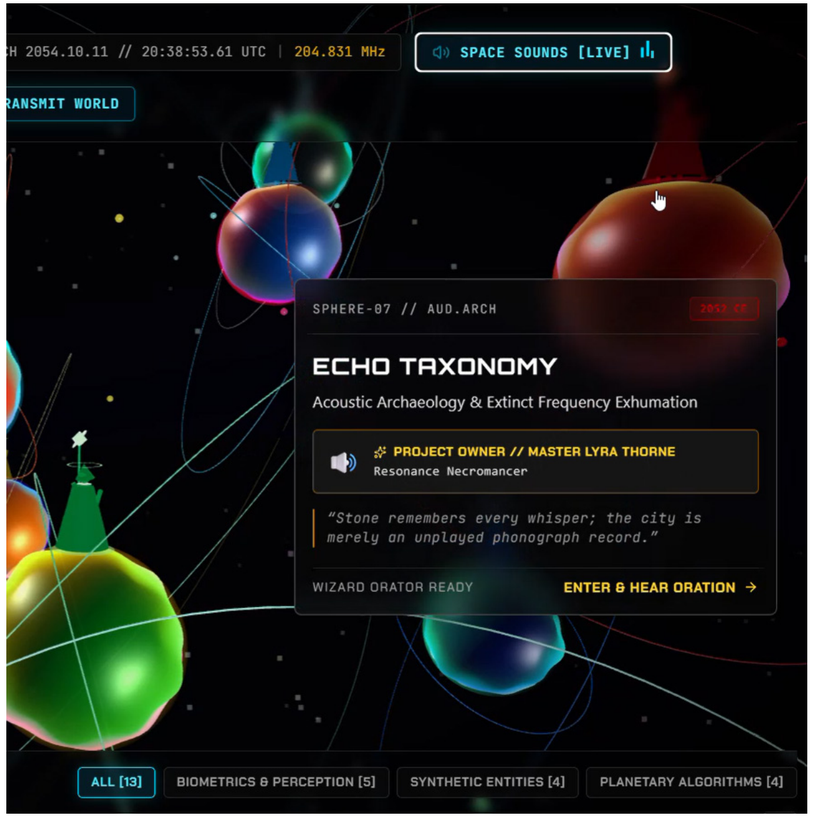

## What Visitors Can Do

1. **Explore the multiverse:** Hover and navigate a 3D cosmos by orbiting, zooming, and selecting planets.
2. **Discover individual worlds:** View planetary information, themes, classifications, and speculative scenarios.
3. **Meet the Wizard Project Owners:** Listen to narrated stories with synchronized subtitles.
4. **Experience interactive simulations:** Experiment with systems such as surveillance, neural link. cetacean etc
5. **Filter and navigate:** Browse planets by thematic categories or move between adjacent worlds.
6. **Create new worlds:** Use the transmission interface to configure and add speculative planets.
7. **Experience ambient sound:** Listen to a generative cosmic soundscape that responds to navigation.

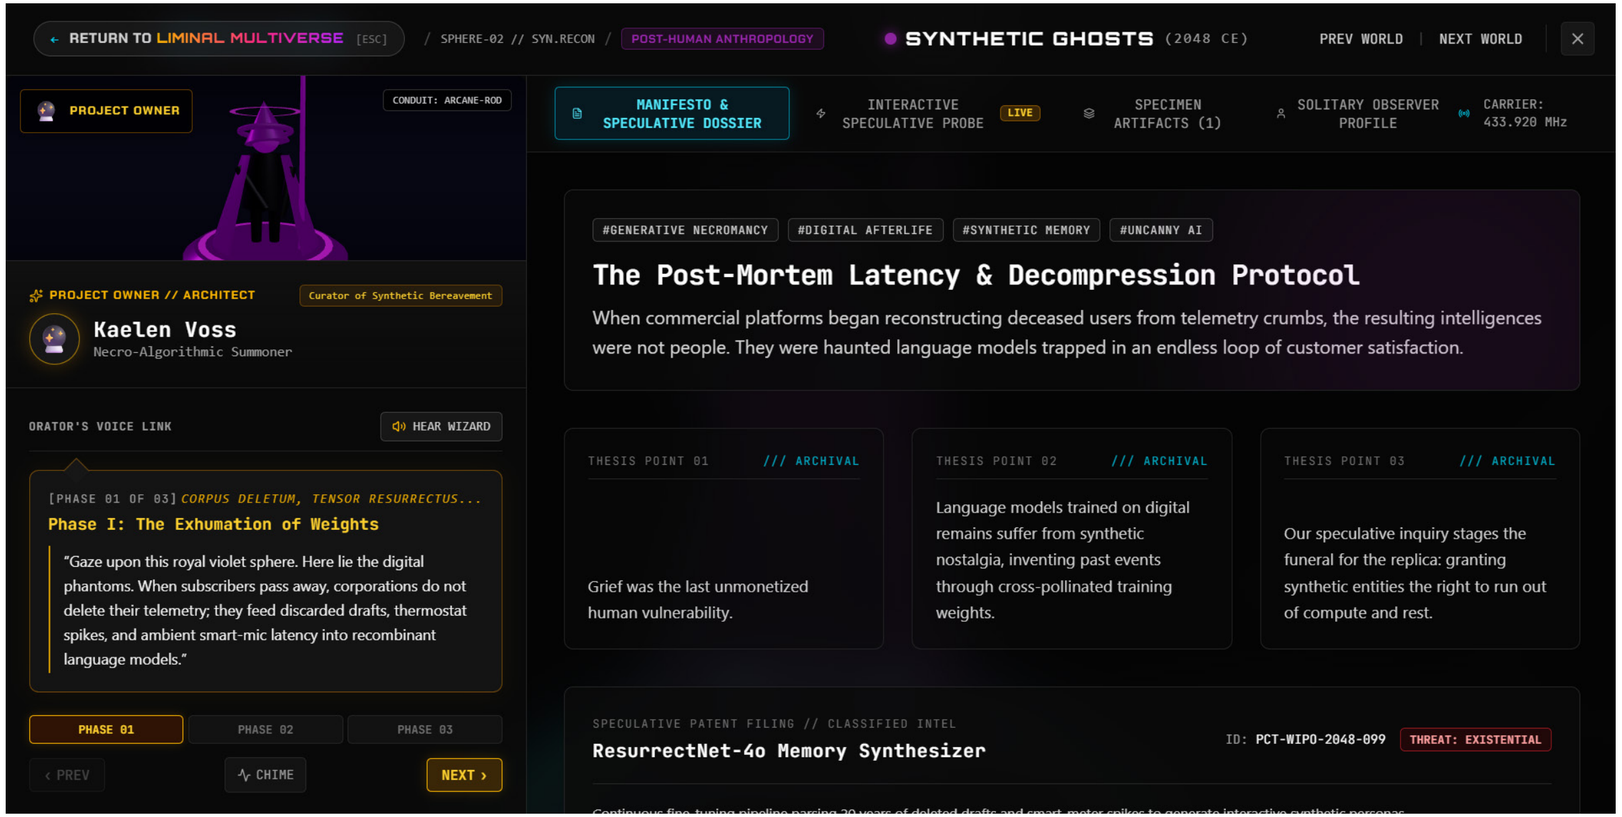

An option to directly add/ Create new world

Discovering individual worlds

A brief explanation about the project with the Wizard ⟨project owner's avatar⟩ explaining the idea

## What Changed After Testing & Iteration

As I tested the website, I realised that creating an immersive experience was about knowing what to simplify and refine a large set of information into fun yet legible way. I initially had more than 20 planets, reduced the collection to 13, giving each world more space and a clearer identity.

The ambient sound was another issue. It was too quiet to be noticed on regular laptop speakers, so I increased its volume and refined the audio levels. I also noticed small clicks and harsh static in the background. To fix this, I replaced the noisy sound loops with smoother, layered tones and gradual transitions, creating a more seamless cosmic soundscape.

I then revisited the interface. The extra controls for orbits, stars, and alignment distracted from the planets themselves, so I removed them and brought back a dedicated button to switch the space sounds on or off. I also made the category counters dynamic, so they automatically reflect the actual number of planets rather than displaying fixed numbers. Once you click on each planet, I wanted the wizard to be present on left narrating the project, however my vision for that was not very successfully delivered.
