CASE STUDY

This study aims to explore how the imagined realities/ dreamy visuals evoke some memory, feelings of users or memories of dreams of their own. Across the three dreams, the automatic transition time gradually increases, giving users more time to experience each environment. The visuals also slowly move from abstract forms towards more realistic and familiar surroundings.

Through this process, I want to explore how/if people connect with these different visuals. Some environments might remind them of their own dreams or bring back certain feelings or memories. Others might simply feel like a visual or "Virtual Reality" experience.

This is an ongoing personal exploration where I am documenting how people respond to each environment and which one they connect with the most. I am curious to see whether these imagined spaces can make people feel something personal or remind them of an experience of their own or nothing at all.

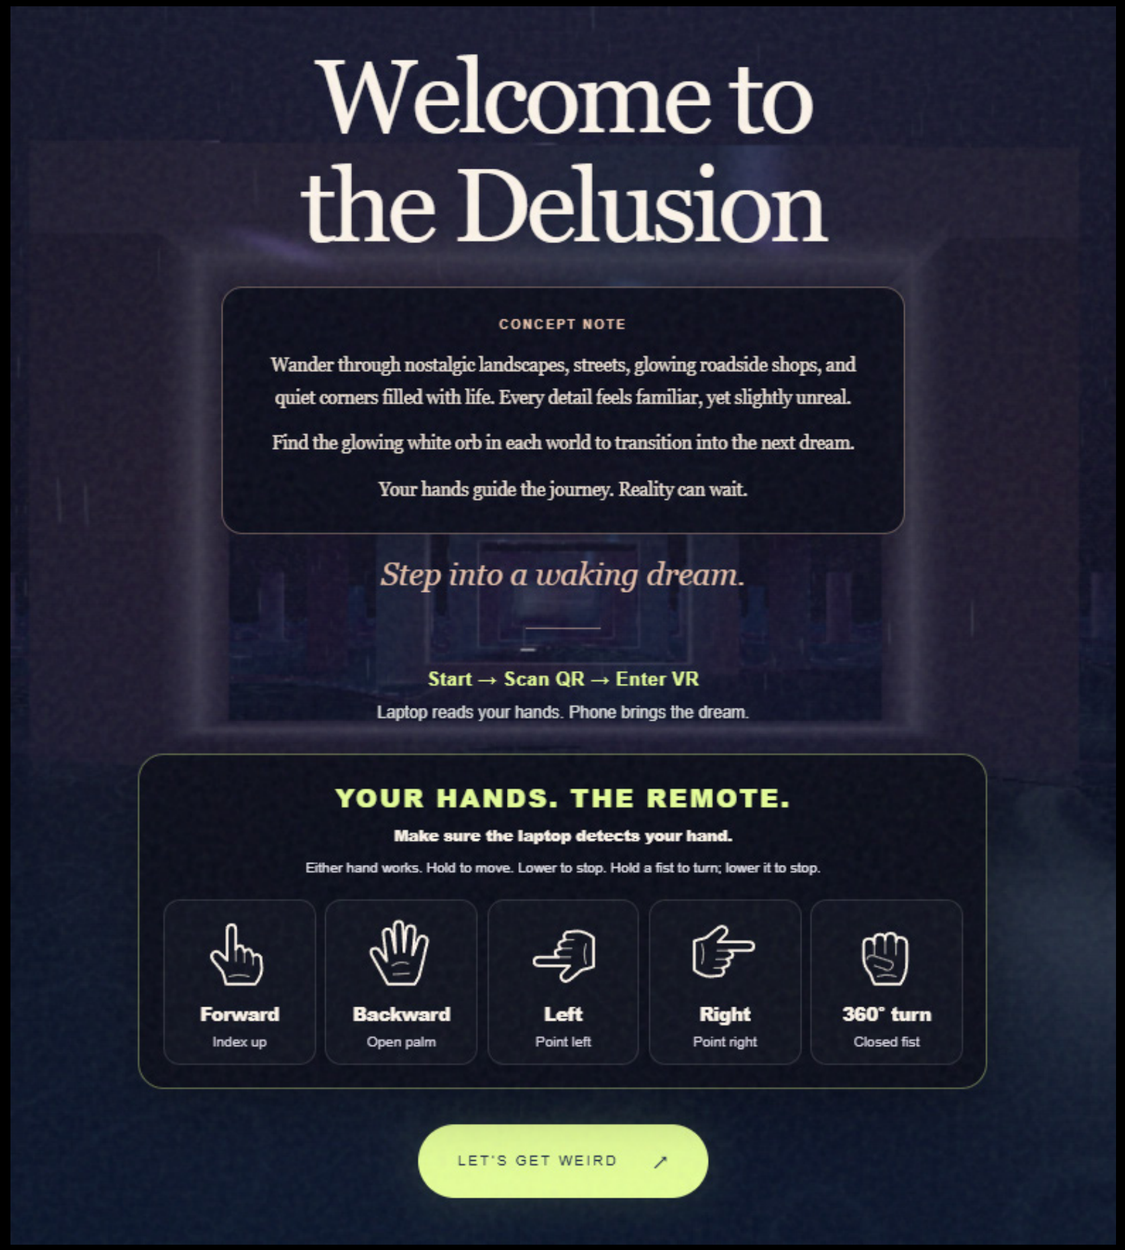

*Added clay to a cardboard VR for extra nose support :)

PILOT PAGE

The opening page briefly introduces the simulation and explains the navigation rules, along with a few hints about what the experience is about. The aim is to keep the instructions short and clear without overwhelming the user with too much information.

Input	Behavior
Index finger pointing up	Forward movement
Open palm	Backward movement
Index pointing left/right	Left/right navigation
Closed fist held	Initiates a smooth 360° turn
Fist lowered or released	Stops the turn
Two hands visible	Selects the most convincing recognized gesture
Phone head orientation	Controls the VR viewing direction
Laptop scene change	Intended to update the connected phone's scene automatically

VISUAL 1 - UNDER BRIDGE

The opening dream places the participant beneath a bridge, surrounded by repeated arches, moving water, and rain. The intention is to encourage exploration while creating unease through the environment.

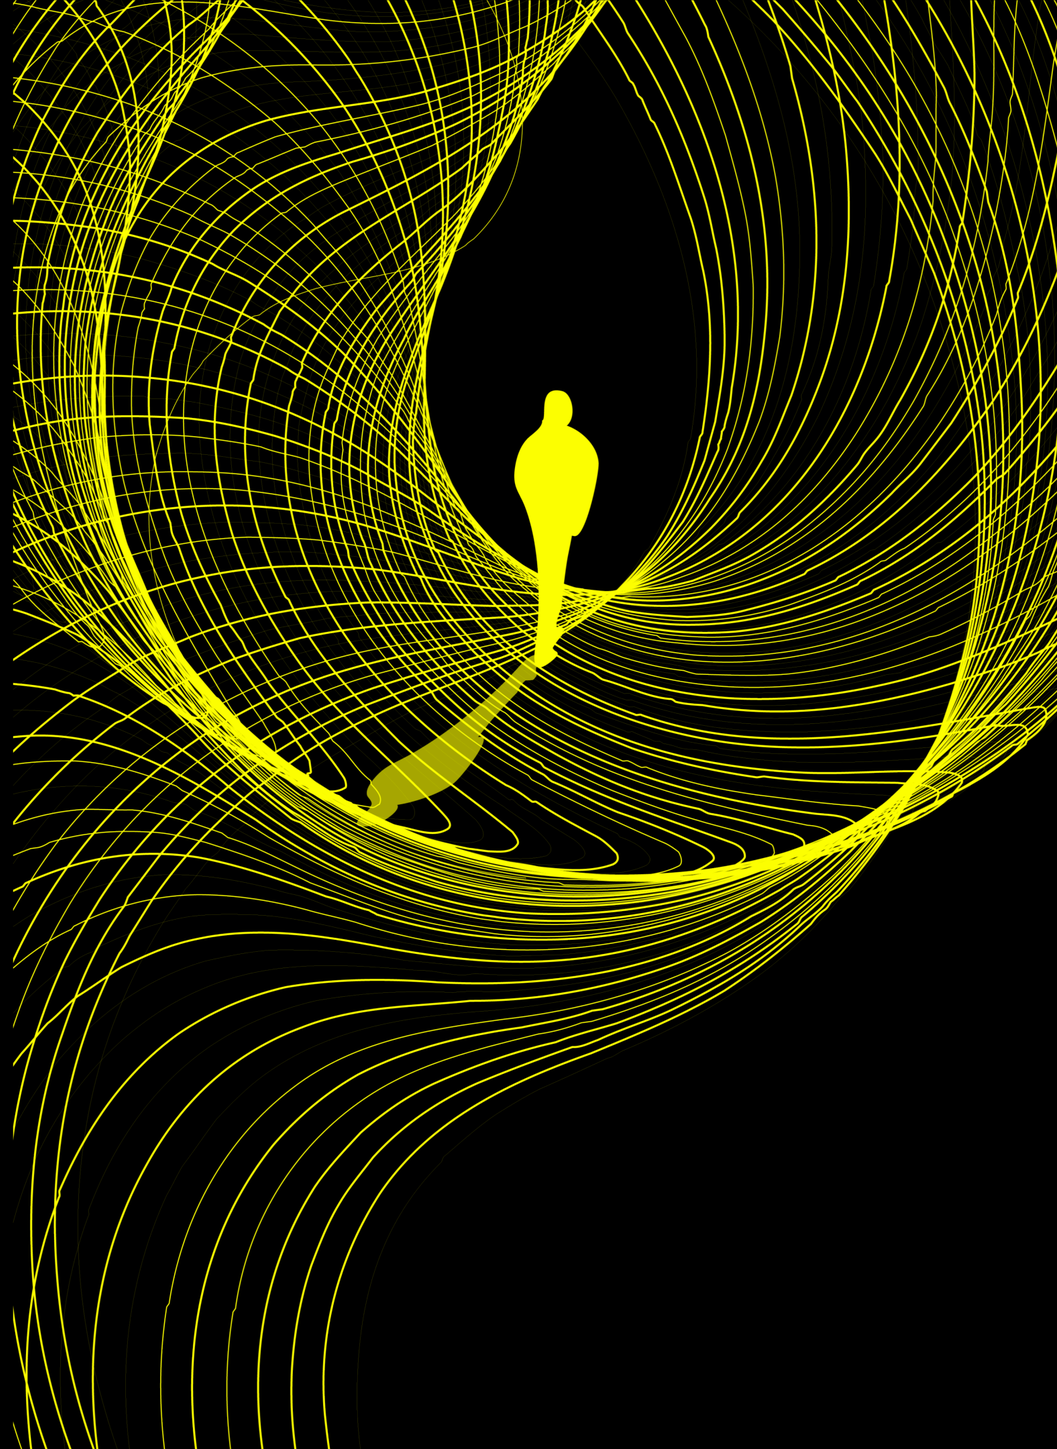

Decisions:

Removed the ceiling snakes and the look-up white-screen trigger that transitions to next visual. A red circular vortex was explored, then replaced with an intense white glow ball because the portal looked artificial.

The dream shifts to Visual 2 when the user reaches the light or after 2 minutes 30 seconds, through a white fade. This glow ball sits farther along the bridge, roughly 70 units from the starting position, with a subtle hint visible from the beginning.

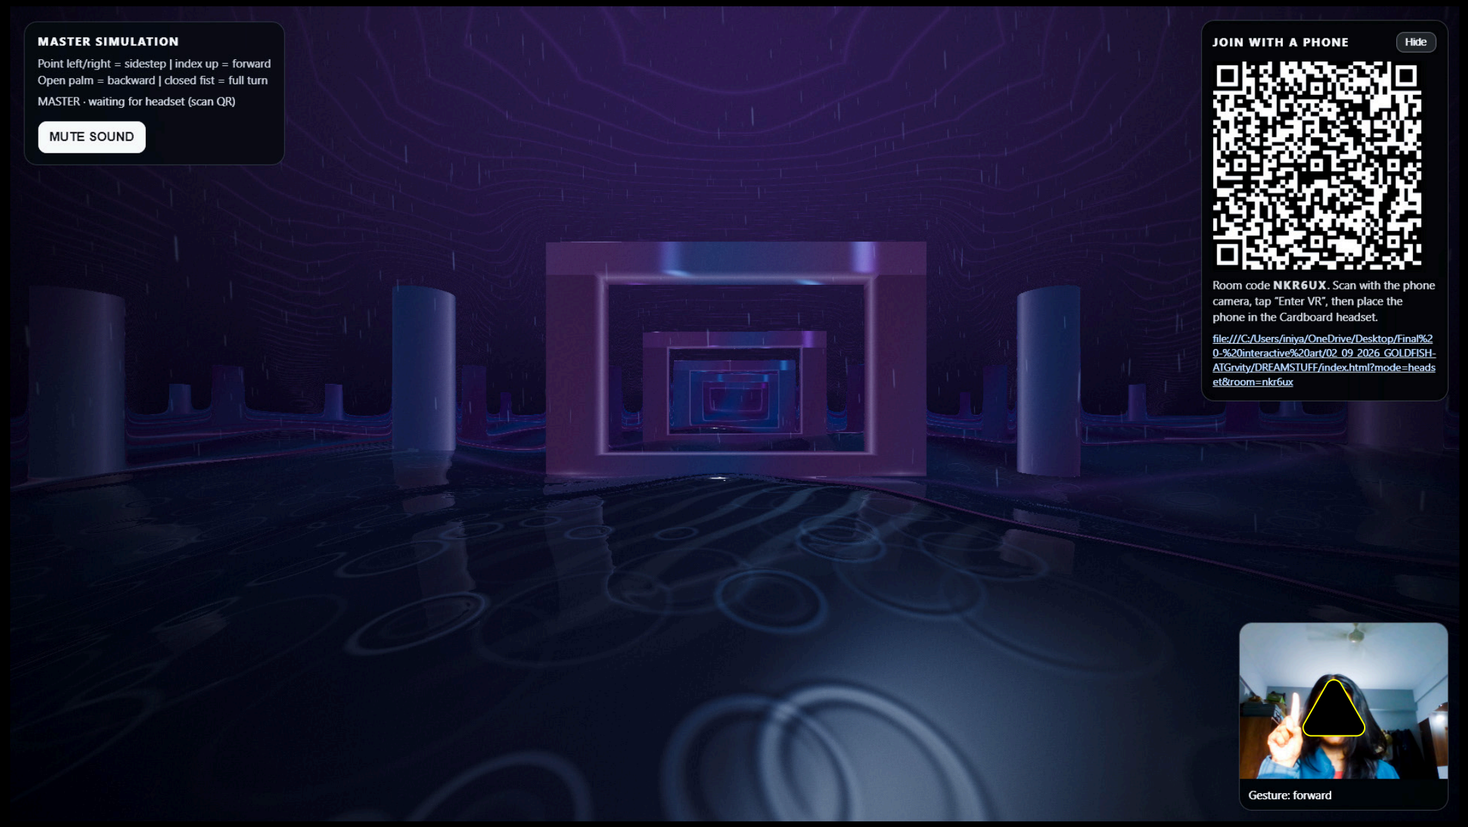

Process:

Worked step by step on free movement, the portal, water, rain, and ripples, maintaining a clueless and abstract visual. The waves were made to look more realistic also reflects a bit on the ceiling. Those corrections shaped the more grounded environment.

VISUAL 1 - SCREENSHOTS

VISUAL 2 - GREENSCAPE

A walkable rural landscape inspired by your references: fields, grass, shallow reflective water, distant trees, and a warm pale yellow-green atmosphere. Translucent cellular structures should feel embedded throughout the landscape.

Decisions:

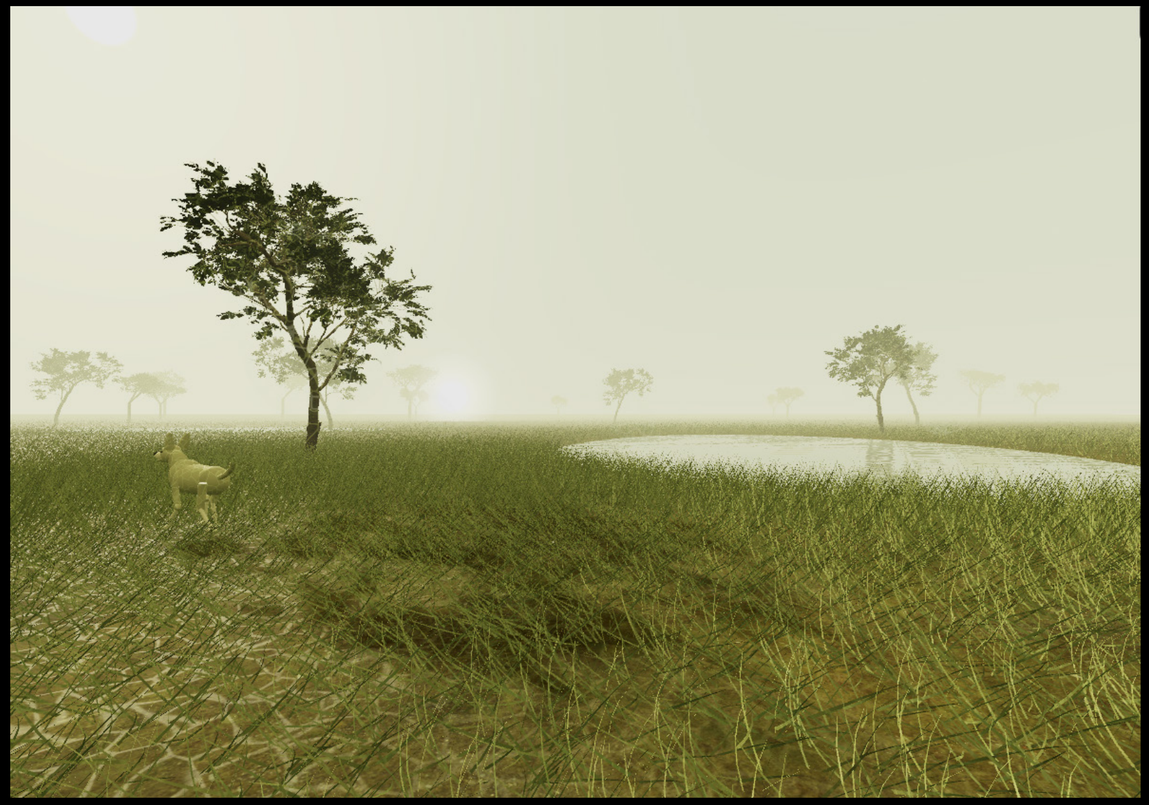

The cellular language needed transparency, distortion, lighting, and movement within the world. Attempted to create a calm environment where the user would like to just move around for few minutes. Added strong wind, a dog that runs and disappears in loops, and a bright white transition light. The scene shifts to Visual 3 when the light is reached or after 2 minutes.

A separate interruption begins 10 seconds into Visual 2: the supplied frightening face rushes toward the viewer and remains part of a 3-second jump scare.

Process:

The rural scene was built with Three.js, shaders, and vegetation assets. Later work addressed mobile stereo clarity, head-turn direction, the jump-scare image's sharpness and motion, and scene-linked audio.

Grasshopper and subtle nature ambience pause during the jump scare. Supplied goat scream plays during it, and nature ambience resumes afterwards.

VISUAL 3- NEIGHBORHOOD

A living Indian neighborhood with street vendors, pedestrians, bicycles, shops, wet-road reflections, and warm dusk lighting. Your original direction was a neighborhood captured on vintage 35mm film dreamy, but believable.

Decisions:

Realistic human proportions, natural walking, everyday clothing, subtle gestures, and varied activity.

A small distant roadside fire, with believable smoke and flickering light. Side mist added dreamlike depth. Later, Benjamin Bardou's The Flow and your reference image informed denser signage, colored light, and a more layered urban atmosphere.

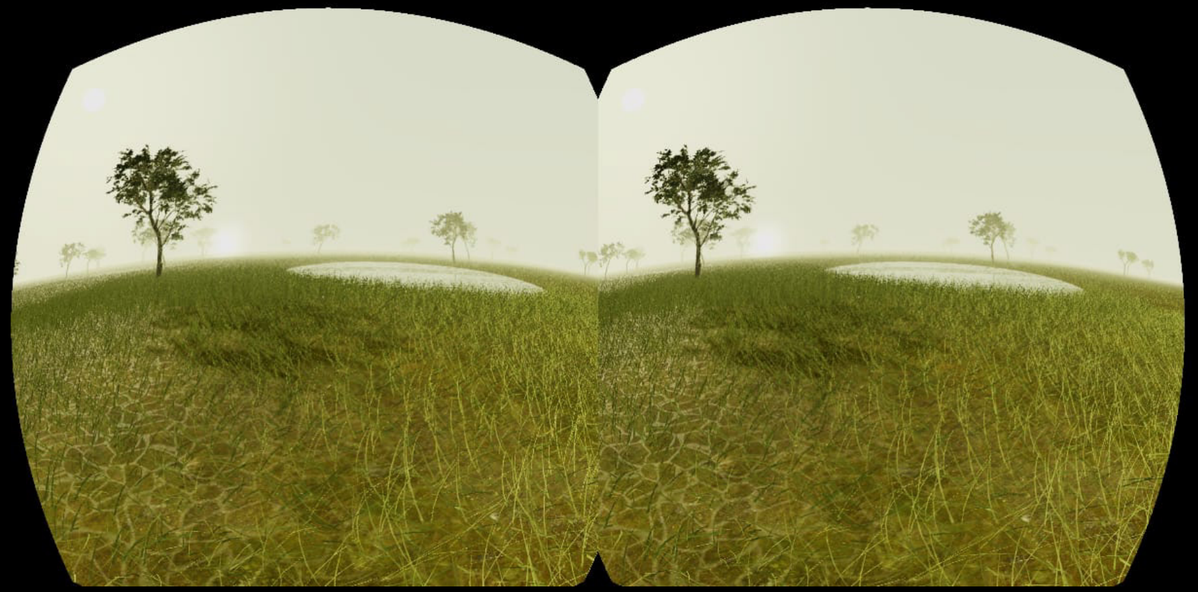

drone-like route: street-level travel, irregular elliptical movement, and flight above rooftops.

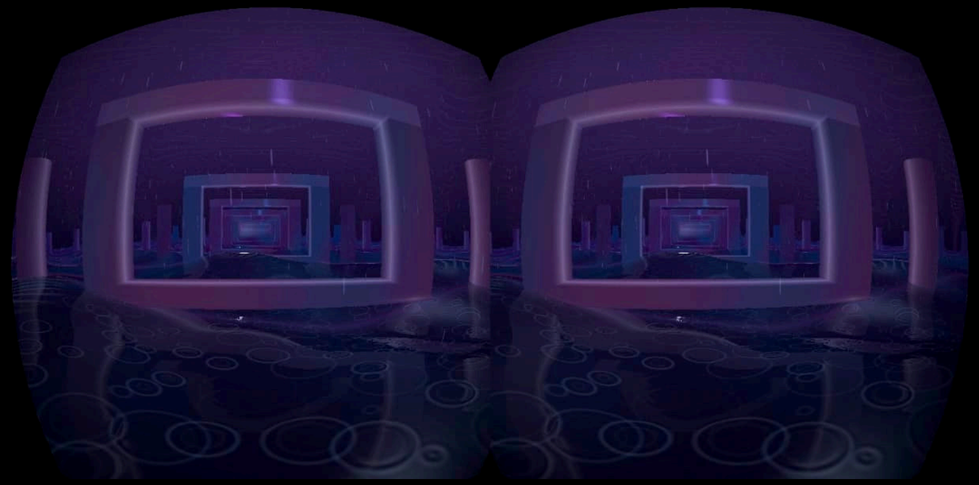

Process:

Developed the street environment, the scene has market ambience with subtle night sounds. The current result is a developed first pass; the full brief for varied ages, distinctly Indian clothing, and consistently photorealistic human behavior still needs refinement.

SCREENSHOTS VR VIEW FROM MOBILE

SCOPE FOR IMPROVEMENTS & FEEDBACK

1. The visuals can be improved aesthetically - Adding a mist on the corners.
2. Add more relatable dream visuals - Falling from a building.
3. Adding spiritual indications - snake, peacock, fire etc
4. Build a narrative
5. Gamify the process
6. Improve the navigation rules - make it more simpler
7. Navigation gestures can be replaced with Joystick.
